

**AK 2031**  
**LANDING GEAR DUST**

This is an enamel product to recreate natural dust effects on landing gear and tires. Simply apply it to your aircraft wheels or landing gear to achieve the most realistic effect possible.

Apply the product over the areas where the dust is more likely to concentrate.

Don't hesitate to apply the dust effect as you can soften the effect with a flat brush moistened with white spirit after the paints has dried for several minutes.

Repeat the process until you are satisfied with the results.

Remember to let the paint dry for several minutes so it can set itself in all crevices and around details.

The final results are amazing...

Combined with other products from the Air Series the possibilities are almost unlimited. But study well your reference material in order to create the most realistic results.
